July 2001	Economic Policy Research Unit, University of Copenhagen
June-Aug 1998	Kobe University
Sep '92-May '93	Indian Statistical Institute - Delhi Centre
Sem 1, 1983-84	University of Wisconsin-Madison
Sem 2, 1977-78	Slippery Rock State College

Education

1977	Ph.D., Economics, Southern Methodist University, U.S.A.
1974	M.A., Economics, Delhi School of Economics, India
1972	B. A., Economics, Utkal University, India

Fields of Research Interest

International Trade
Economics of Terrorism
Growth & Development
Macro & Business Cycles

Research, and Book Writing Agenda

In the next five years, my objective is to accomplish research two separate areas, (a) economics of terrorism and (b) service sector and trade in services, and write three books.

Economics of Terrorism: In my previous research I've tried to understand how defensive and offensive counter-terror (CT) measures may work in different scenarios. For instance, in the face of an exogenous increase in militancy or terrorism, is it rational/optimal for target countries to step up both defensive and offensive measures? According to my previous research it is always optimal to enhance security-deterrence (defensive) measures as terrorism increases (in terms of a decline in the marginal cost of 'producing' terror), but stepping up offensive or preemptive measures may not always optimal. In other words, offense may not always be the best defense.

Existing theoretical work of terrorism till date that have attempted to model the behavior of terror organizations (including my own research) have almost exclusively assumed that the objective of a terror organization is to inflict damage on target countries, i.e., terror organizations derive "utility" from the expected damage that they inflict upon the target countries by use of terror inputs that are costly. However, terrorism (as opposed to other forms of violence, e.g., homicide) is defined in terms of a long term political or ideological goal by individuals or organizations who use terror as a (short term) means to an end. The U.S. Department of Defense describes terrorism as "the calculated use of unlawful violence or threat of unlawful violence to [inculcate fear](#), intended to coerce or to intimidate governments or societies in the pursuit of goals that are generally political, religious, or ideological."

My recent research builds a novel two-sided asymmetric-information game model between a terror organization and a target country that precisely deals with such long term objective of terror groups. Unlike earlier literature, a terror organization does [not](#) derive directly utility from damage caused by terror: terror is used as a means to coerce a target country to redress their grievances, where redressing grievances is termed as [preventive measures](#).

In the **International Journal of Economic Theory** paper published online in December 2019, "[Why Direct Counter-Terror \(CT\) Measures Only May Fail: An Analysis of Direct and Preventive CT Measures](#)," a joint work with Sajal Lahiri at the Southern Illinois University, we have articulated a situation where the [war on terror cannot be won by preemptive measures only, but can be, if these measures are combined with preventive measures](#). The abstract of this working paper is as follows:

Abstract: We present a model of three-period game between a terrorist organization (Org) and a defending state (State), where the Org chooses aggregate terror input and the State chooses (a) the level of preemptive measures which shift the marginal cost curve facing the Org and hence affect the supply curve of terror, and (b) the level of redressal of grievances of the Org's population which affects the derived demand for terror as a means to an 'end' (demand). (a) and (b) are interpreted respectively as direct and preventive counter-terrorism (CT) measures (equivalently as stick and carrot policies). There is two-sided asymmetric information: the Org and the State do not fully know each other's preferences. A central result is an 'impossibility theorem' that the State cannot win the war on terror with preemptive measures only as long as the marginal cost of preemptive measures is increasing. In general, the optimal response of the State to an exogenous increase in terrorism or militancy is to increase preemption as well as grant more grievance redressal. Hence, direct and preventive CT measures complement each other towards countering terrorism: they are not substitutes. The core model is extended to consider an increase in terrorism due to anger and frustration arising from collateral damage associated with preemptive strikes, the presence of heterogeneous groups within a terrorist organization such as moderates and hardliners, a piecemeal conciliatory offer of less preemption and more grievance redressal by the State, and Bayesian learning by the Org of the preference of the State if the State grants any further grievance redressal.

A Book on Economic Analysis of Terrorism: Based on my research — and more so on my teaching of Terrorism at the upper undergraduate level at UIUC over six semesters — I have written the draft chapters. I expect to publish it very soon.

Trade in Services: It is well-known that importance of services in total trade has been growing — and more and more data is being available on trade in services. In recent years, world manufacturing trade to world GDP ratio has flattened but world trade in services to world GDP ratio continues to rise. It is somewhat surprising that current theoretical and quantitative (empirical) literature on trade mostly attempt to understand trade in manufactures or trade in “goods” as opposed to services.

I wish to understand how trade in services may be related to, yet differentiated from trade in manufactures. In a [working paper joint with Scott Bradford \(Brigham Young University\) and Anuradha Saha \(Ashoka University\)](#), a version of which is available, we demonstrate a contrast in the pattern of comparative advantage in manufacturing vis-a-vis services across countries: Larger countries and/or larger per-capita countries tend to have comparative advantage in manufacturing whereas smaller and/or smaller per-capita countries tend to comparative advantage in services. Put differently, the comparative advantage index (measured by Balassa's revealed comparative advantage) in services is negatively related to country size and per-capita income, whereas comparative advantage index in manufacturing is positively related to country size and per-capita income. The first part of the paper contains theory that derives these patterns. It explores two reasons behind such differential trade patterns: demand bias in consumption towards services relative to manufacturing resulting from non-homothetic preference, and, a higher degree of national product differentiation in services than in manufacturing. The second part presents formal empirical evidence that support these hypotheses.

In another working paper, [“Determinants of Bilateral Trade in Manufacturing and Services: A Unified Approach,” written jointly with Vinicios P. Santa'Anna of University of Illinois](#), we try to understand how bilateral trade in these two product categories are explained by scale and trade cost variable and what the

differences between them are. A major innovation in the paper lies in bringing out the role of bilateral internet link between trading countries as a factor influencing bilateral trade in both product categories.

A Research Monograph on Trade in Services: Apart from the paper discussed above, I have other research plans on trade in services. Once I have three or four completed papers, I intend to write a monograph.

Second Edition of a text on Economics for Managers: I am coauthoring the second edition with Dr. J. K. Goyal of Jagan Institute of Management, New Delhi, India. The first edition, authored by me, is titled *Microeconomics for Managers*.

Teaching Experience

University of Illinois at Urbana-Champaign

Graduate and Undergraduate

2015-18

International Trade - Ph.D. Apart from traditional competitive models of trade like Ricardian, Heckscher-Ohlin and sector-specific, and, models of imperfect competition, scale economies and product differentiation, it covered the Eaton-Khortum model, the Melitz model, the Yeaple Model, the Arkolakis-Constinot-Rodriguez-Clare Theorem, different generations of gravity models as well as some aspects of commercial policy including rationale behind the principles of WTO. Except for the last, each topic was discussed in two parts: theory and empirics.

International Trade - Masters. It covered various comparative advantage models – Ricardian, Heckscher-Ohlin and sectors-specific with lots of examples — trade policy for small and large countries and under competitive and non-competitive markets, various indices of trade competitiveness, trade under imperfect competition and welfare gains in terms of gain in product variety and productivity, international outsourcing, gravity models of trade.

Economics of War and Terrorism - Higher Undergraduate. Definition of terrorism as a means of violence, why rational behavior can be applied to understand terrorism, various facts and figures about global terrorism, different terror organizations, their origin and objectives, Kruger and Robert Pape's research on what drives terrorists and suicide terrorism in particular, Landes' model of skyjacking, interdependence among target countries in terms of security-deterrence and preemptive measures, game models between target countries and terror organizations, an analysis of preemptive and preventive counter-terror measures, terror cycles, Lanchester's combat models, Richardson's models of arms build-up, Intriligator-Brito model of missile wars, Robert Autmann's war and peace game model, economic efficiency of army recruitment methods, a model of military coup, civil war, ethnic conflict.

Economics of Financial Markets - Higher Undergraduate Overview of the U.S. Financial System, Asset classes, instruments and financial markets, financial intermediaries, expected utility hypothesis, risk-aversion and mean-variance space, portfolio theory and single index model, capital asset price model, arbitrage theory and multi-factor models of risk and returns, efficient market hypothesis, behavioral finance, equity valuation, fixed-income securities and interest rates, pricing of futures, forwards and swaps, option pricing, credit derivatives, financial crises and the role of financial markets in the Great Recession, nonconventional monetary policy, finance-sector reforms and regulations
